Summary

Backend Engineer with over 3.6 years of experience building **scalable, production-grade** backend systems and distributed services in Go and NodeJS. Specialized in microservices, API design, and performance optimization. Strong collaborator with a focus on reliability, observability, and system design in high-throughput environments.

Professional Experience

Software Developer Engineer (SDE - 1), Samsung – Chennai

Aug 2022 – Present

- Developed and scaled a Go-based data pipeline service handling over **1M records/day** across 15+ microservices for a global e-commerce platform, acting as the central integration layer and serving as the primary point of contact for 3.6+ years.
- Reduced pricing update **latency by 80%** by eliminating 95% of redundant API calls through custom deduplication logic.
- Migrated the routing layer from **Gorilla Mux to Gin**, boosting middleware efficiency and increasing request throughput by 25% under high-concurrency loads.
- Improved real-time data processing by 15% via **concurrent plugin execution** using goroutines and channels in Go.
- Designed a modular backend plugins (API batcher, RabbitMQ serializer, Elasticsearch puller), enhancing reusability and observability in distributed environments.
- Built a tiered pricing upload capability that supported ingestion of large B2B files (more than 6000 SKUs), reducing upload failure rates by 30%.
- Integrated APIs from UPS, FedEx (EDI), and PitneyBowes, **improving shipment tracking** accuracy by 70% and reducing SLA breaches.
- Enhanced the Fraud microservice by **integrating Signifyd's** fraud detection APIs and Decision Center, enabling custom fraud policies that improved detection accuracy and reduced false positives by 20%.
- Owned external integration lifecycle with FedEx and UPS, managing onboarding, API testing, and production rollout.

Software Engineer Intern, Samsung

Mar 2022 – Jul 2022

- Built a low-latency product recommendation engine using MLP, achieving a loss of just 0.0018.
- Designed a **Solana**-based crypto payment prototype using Node.js and web3 libraries for secure transactions.

Backend Intern, TBS

Dec 2020 – Jan 2021

- Built 2 IoT devices using Arduino Uno to monitor and transmit power usage data from medical equipment with 95%+ accuracy, enabling proactive energy management.
- Developed a Node.js-based application to ingest, store, and visualize IoT data in real-time with less than 1s latency.
- Created a blockchain-backed system for recording patient medical history using **Ethereum** smart contracts.

Achievements

- Runner-up**, Samsung Hackathon 2023 — Optimized pricing pipeline, boosting system efficiency and reliability.
- Runner-up**, Samsung Hackathon 2025 — Built a voice-enabled AI customer support assistant using Whisper (STT), LLaMA-3, and Eleven Labs (TTS), enabling automated resolution of customer queries via context-aware responses.
- Awarded for end-to-end ownership and successful delivery of a high-reliability backend data pipeline service.
- Led planning and execution of "Itrix," a national-level technical fest with 1,000+ attendees.
- Developed a freelance .NET and MySQL-based application tracking system for **ITC Ltd**, enhancing project tracking and reporting.

Skills

Languages: Go, Java, Node.js, C++, SQL

Frameworks: Gin, Spring Boot (familiar)

Databases: PostgreSQL, MySQL, MongoDB

Messaging: RabbitMQ, Kafka (familiar)

Tools: Elasticsearch (ELK stack), Kibana, Grafana, Docker, Prometheus, PagerDuty, Rancher

Cloud: AWS (S3)

Architectures: Microservices, Event-Driven Systems, RESTful APIs, CI/CD Pipelines

Education

College of Engineering, Guindy, Anna University

2018 – 2022

B.Tech in Information Technology – **CGPA: 8.9/10**
